Layton City is pleased to present you with the 2013 Drinking Water Quality Report. This report contains information about the quality of the water delivered to you everyday. The City's constant goal is to provide you with a safe and dependable supply of drinking water and we want you to understand the efforts made to continually improve the water treatment process and protect your water resources. Layton City is committed to ensuring the quality of your water.

Layton City’s drinking water meets all Federal and State requirements.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPAs Safe Drinking Water Hotline at (800) 426-4791.

Layton City routinely monitors for constituents in your drinking water in accordance with Federal and Utah State laws. Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- Radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.
Where does my water come from?

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pickup substances resulting from the presence of animals or from human activity.

Layton City’s water sources include groundwater from City wells and purchased water from Weber Basin Water Conservancy District (WBWCD). You may receive a blend of both sources, depending on the time of the year and your location in the City.

Groundwater is drawn from the Delta Aquifer by the following wells: Church Street Well, Hillfield Well, Fort Lane Well, Greenleaf Well, and Shop Well. WBWCD’s water includes treated surface water, which comes primarily from the Weber River and from several creeks along the Wasatch Front. WBWCD also supplements surface water sources with groundwater primarily from the Delta Aquifer. For more information on WBWCD’s Water Quality Report, go to www.weberbasin.com or call 801-771-1677.

What is being done to protect my water?

Layton City Public Works & Engineering Department continues to work toward providing top quality water to every tap. The City asks that all our customers help us protect our water sources, which are the heart of our community, our way of life, and our children’s future. On November 5, 1998, Layton City passed Ordinance 98-72, effectively establishing a Drinking Water Source Protection Plan as Chapter 13.11 of the Layton City Code. The Layton City Code can be viewed at www.laytoncity.org. Additional information regarding the City’s Drinking Water Source Protection Plan can be viewed at the Layton City Engineering office located at 437 N. Wasatch Drive.

The table on the following page shows the results of Layton City’s monitoring for detected contaminants from the period of time from January 1st to December 31st, 2013, or the most recent sampling results within the past five years. The table also shows Weber Basin Water Conservancy District’s monitoring results where applicable, because the District supplies water to Layton City each year.

In order to ensure tap water is safe to drink, the Environmental Protection Agency (EPA) prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Maximum Contaminant Levels (MCL’s) are set at very stringent levels. To understand the possible health effects described for many regulated constituents, a person would have to drink 2 liters of water every day at the MCL level for a lifetime to have a one-in-a-million chance of have the described health effect.

Important Health Information

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. We cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.
### LAYTON CITY WATER QUALITY TEST RESULTS

**Five-year period from 2009 - 2013**

* Turbidity is a measure of the cloudiness of the water. We monitor it because it is a good indicator of general water quality.
** If the sulfate level of a system is greater than 500 ppm, the supplier must satisfactorily demonstrate that better water is available and that the water shall not be available for human consumption from commercial establishments. In no case shall water having a level above 1,000 ppm be used.
*** If TDS is greater than 1,000 ppm the supplier shall demonstrate to the Utah Drinking Water Board that no better water is available. The Board shall not allow the use of an inferior source of water if a better source is available.
Definitions of Terms and Abbreviations

**AL** Action Level - AL is the concentration of a contaminant, which if exceeded, triggers treatment or other requirements which a water system must follow.

**DATE**
Because of required sampling time frames i.e. yearly, 3 years, 4 years or 6 years, sampling dates may seem out of date. The date shown in the table is the most recent sample for the samples included in the detected range.

**HIGH & LOW**
For water systems that have multiple sources of water, the Utah Division of Drinking Water has given water systems the option of listing test results of the constituents in one table, instead of multiple tables. Thus, the lowest and highest values detected in multiple sources are recorded in the same space in the report table.

**MCL** Maximum Contaminant Level - The MCL is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as possible using the best available treatment technology.

**MCLG** Maximum Contaminant Level Goal - The MCLG is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

**MRDL** Maximum Residual Disinfectant Level Goal—The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

**MRDLG**
Maximum Residual Disinfectant Level Goal—The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Additional Monitoring Information

**Radon**
Radon is a radioactive gas that you can't see, taste, or smell. It is found throughout the U.S. At this time, radon monitoring is not required by the EPA; however, the EPA is considering making radon monitoring a requirement. The proposed MCL for radon is 4,000 pCi/L for systems which have a source water. Current test methods do not allow us to determine if the organisms are dead or if they are capable of causing disease. Due to these results, Weber Basin does use UV light in water treatment which inhibits these organisms from reproducing and causing sickness. Ingestion of cryptosporidiosis may cause cryptosporidiosis, an abdominal infection. Symptoms of infection include nausea, diarrhea, and abdominal cramps. Most healthy individuals can overcome the disease within a few weeks. However, immuno-compromised people are at greater risk of developing life-threatening illness. We encourage immuno-compromised individuals to consult their doctor regarding appropriate precautions to take to avoid infection. Cryptosporidium must be ingested to cause disease, and it may be spread through means other than drinking water.

2013 Layton City sampled for the UCMR3 contaminants as required by the UCMR3 Rule. The results of the UCMR3 are included in the results table for each contaminant above the MRLs (minimum reporting level) for each contaminant. For further information on the UCMR 3 Rule contaminants, contact the Environmental Protection Agency’s Safe Drinking Water Hotline at 1-800-426-4791 or visit the EPA website at www.epa.gov/safewater

**Cryptosporidium & Giardia**
Cryptosporidium and giardia are microbial pathogens found in surface water throughout the U.S. Although filtration removes cryptosporidium and giardia, the most commonly-used filtration methods cannot guarantee 100 percent removal. Monitoring conducted by Weber Basin indicates the presence of cryptosporidium and giardia in their source water. Current test methods do not allow us to determine if the organisms are dead or if they are capable of causing disease. Due to these results, Weber Basin does use UV light in water treatment which inhibits these organisms from reproducing and causing sickness. Ingestion of cryptosporidiosis may cause cryptosporidiosis, an abdominal infection. Symptoms of infection include nausea, diarrhea, and abdominal cramps. Most healthy individuals can overcome the disease within a few weeks. However, immuno-compromised people are at greater risk of developing life-threatening illness. We encourage immuno-compromised individuals to consult their doctor regarding appropriate precautions to take to avoid infection. Cryptosporidium must be ingested to cause disease, and it may be spread through means other than drinking water.

Layton City’s drinking water meets all Federal and State requirements.
Every Drop Counts!
PLEASE CONTINUE TO DO YOUR PART IN CONSERVING WATER

Why Should I Conserve Water?

In simple terms, Utah's semi-arid terrain is sprouting another city approximately the size of Salt Lake City about every five years. The Governor's Office of Planning and Budget predicts that the population of Utah will double to nearly 5 million by the year 2050. Utah has earned a spot as one of the fastest growing states in the nation. Unfortunately, it is also the second driest state in the nation.

As Utah's population blossoms, so will the demand for Utah's limited water resources. If Utah's municipal and industrial water demand increase at the same rate as its population growth, the State is headed for trouble. Very simply, there will not be enough water to supply to this population. However, since Utahns currently use more water than they need, particularly in watering their landscapes, the opportunity exists to avoid many of these problems by reducing use to a more efficient level.

How Can I Help?

The American Water Works Association estimates that between 59 to 67 percent of water use in residential areas is outdoors. This clearly represents the area of the greatest potential water savings. Therefore, we offer these suggestions to conserve water outdoors:

- Water your lawn no more than twice a week. Your lawn will get accustomed to reduced watering.
- Water after 6 p.m. or before 10 a.m. to avoid evaporation.
- Keep sprinklers from watering pavement. Position them so that water lands on the lawn and shrubs.
- Cycle your watering so most of the water gets into the soil. High clay-content soils absorb water very slowly, so it is necessary to apply no more water than the ground can absorb. Over-watering does not help your lawn.
- Remember to turn off your sprinklers during rain and reset your automatic sprinkler system as the season changes to eliminate unnecessary watering. Homes with automatic sprinklers use up to 50 percent more water than manually operated systems.
- Treat brown spots in the lawn with the hose instead of running the entire sprinkler system.
- Use drip or soaker-type irrigation for all plantings except turf.
- Aerate your lawn. This increases water infiltration into the soil, allowing more water to get to the root zone. Aerating also adds air to the soil, which aids plant growth.
- Avoid over-fertilizing. Fertilizer increases the need for water.
- Set lawnmower blades to cut grass at about 3 inches. Mowing grass shorter dries out the soil faster and increases water use.
- Use 2 - 3 inches of mulch in flowerbeds to maintain soil moisture and reduce watering requirements.
- Leave grass clippings on your lawn. This will reduce evaporation and add organic matter to the soil, allowing it to retain more water.
- Sweep sidewalks and driveways instead of using a hose.
- Use a commercial car wash or a bucket of water instead of the hose when washing your car.
- Always use a hose nozzle instead of an open-end hose.
- Install efficient irrigation systems such as drip irrigation or soaker hoses.
- Use sprinklers that emit large drops of water to reduce evaporation and wind over-spray.
- Encourage others to do their part. Talk to friends, neighbors and co-workers about your efforts to conserve water and encourage them to do the same.
Cross-Control Program Public Awareness

One of the greatest public health risks lies in the possibility of introducing a contaminant into the public water supply. The risk is especially troubling because the water distribution system can provide a conduit for the quick spread of the contaminant to a large population. A cross connection is any physical connection to the City water system that may allow contaminants to come in contact with drinking water. Layton City continually strives to reduce the risk of contamination of our potable water supply. Section 13.06 of the Layton City Municipal Code outlines this effort.

The objective of the cross connection program is to reduce the risk of contamination by evaluating and eliminating potential health or system hazards commonly found in the community. The strategy that Layton City uses is called "containment strategy," which contains each individual service connection at the meter with a backflow valve. Layton City's program is divided into the following two areas:

1. **Residential** (service lines smaller than 1 1/4\(\text{"}\)): These types of service connections are generally considered low hazard and adequate backflow protection is normally provided by a dual check valve installed at the meter. For residential construction newer than November 1991, the backflow device has been installed at the meter by the developer's contractor. For residential connections older than November 1991, the backflow device shall be installed at the meter by Layton City through an ongoing program.

2. **Commercial** (service lines larger than 1 1/4\(\text{"}\)): These types of service connections pose varying degrees of risk to the public water system. The type of backflow assembly required depends on the type of business. A hazard assessment performed by the City can determine the required type of assembly. It is the business owner's responsibility to purchase the backflow assembly and hire a licensed plumber to install it at the water service entrance. Within ten days of initial installation, the assembly must be tested by a certified backflow technician and a test report must be sent to the City. This test and report must be updated annually.

Finally, if you have an outdoor sprinkler system that runs on secondary water AND has the option to switch to culinary water when needed, you are most likely at risk for cross-contamination into your home. Contact the Public Works Shop at 801-336-3720 for assistance in determining if your home is at risk with this type of system, or if you have any other questions about hazard assessment, compliance, or acceptable assemblies.

Questions? Suggestions?

If you have any questions about this report or about your water, please contact James "Woody" Woodruff, Layton City Engineer, Stephen Jackson, Water Engineer, or Greg Harrah, Water Supervisor, at the Public Works Engineering Office at 801-336-3700. You may also email sjackson@laytoncity.org.
